

AI-Powered Product Development Playbook

From Idea to Market 3x Faster

Emerson Taymor

InfoBeans
CREATING WOW!

Introduction

What a time! The hype cycle is in full swing. Are people actually using AI, or are they just talking a big game?

I believe that AI can help us do our work faster and better.

Technology teams got too confident, perhaps greedy during the Zero Interest Rate Period (ZIRP) years.

It is time to do more with less. To deliver more products to the market that deliver business outcomes and user wins.

The average number of employees that a S&P 500 company needed to generate \$1M in revenue was 8 workers in 1990, 4 workers in 2000 and just 2 workers today.

Technology has enabled that efficiency growth. With AI we will see companies generating hundreds of millions or even billions of dollars in revenue with fewer than 10 employees.

This book is an early playbook to help you generate more with less by leveraging AI.

Who Am I And Why Am I Writing This Book

Hey! I'm Emerson Taymor. I consider myself an explorer. I'm passionate about helping companies launch digital products that drive tangible business outcomes with a high return on investment (ROI).

I have been building websites since I was in middle school. I worked as a freelancer and then spent 12 years building a digital product consultancy called Philosophie. In 2019, we sold Philosophie to InfoBeans, where I now lead the design and innovation team. Throughout my career, I've had the privilege of helping hundreds of companies design, build, and launch successful digital products.

I've long felt that we product and design folks sometimes get too caught up in our own work and don't always think about the business outcomes or ROI of what we do. But as an entrepreneur, I've always been scrappy and focused on building profitable companies.

Now, with the rapid rise of AI in the tech scene, I'm on a mission to help teams work better and faster. My goal is to help our clients achieve better outcomes and launch better products to market that genuinely improve people's lives or jobs.

At InfoBeans, we've been building enterprise technology since 2000. We've seen a lot of changes in how products and platforms are built over the years. We're constantly monitoring these changes and testing out how we can leverage them in our workflow to deliver even better results for our clients.

What I Want From You

This is a work in progress. I am exploring and learning every day. Have you tried something that I didn't mention? Let me know!

Does your company need help integrating AI? InfoBeans and I can help you to improve your team's product development process. We can also integrate AI into digital experiences and products.

Get in touch:

✉ emerson.taymor@infobeans.com

 LinkedIn

 InfoBeans.com

Lastly, I am continuing to explore the intersection of AI and product development in my email newsletter series, How To Use AI To, where I investigate how humans with an AI sidekick win.

Potential Business Impact

In a controlled experiment conducted by Harvard Business School at BCG, consultants experienced a 33% increase in productivity and achieved a 40% improvement in quality using GPT-4 compared to colleagues working without AI. Even among these elite knowledge workers, AI reduced the gap between high and low performers. The biggest gains were made by the low performers.

Legendary User Experience Designer, Jakob Nielsen, predicted, "My guess is 100% productivity gains from AI-supported UX work."

For comparison, the annual growth of labor productivity in the US is 1.4% and in the EU, it is 0.8%.

AI will expedite the building process and enhance the likelihood of success.

These tools will allow you to launch experiments faster than ever before. While this may lead to more unsuccessful products, it also means more opportunities and chances for successful outcomes.

Laying The Groundwork

It is crucial to understand that as of this writing, AI can not do your entire job for you- at least not well.

It is unclear if it will ever gain that ability. But AI can help you do better work, faster.

OpenAI CEO, Sam Altman, said that AGI will be:

**A median human with
all the knowledge.**

I believe that LLMs **today** are:

**An autocompleter with
all the knowledge.**

(That act very confident in its answers)

This is important for two reasons:

1. You are getting the median or the average of knowledge. So a lot of experienced practitioners see what the LLMs return and think- “wow this is very mid”. And it is! It is by default average.
2. The LLM responses are very confident. They sound smart. But this doesn’t mean it is right.

I use AI as a thought partner. A co-pilot. I prod it for more information. Ask it to rephrase something. If you had a thousand interns, what would that enable for you? These interns will not be able to create the best or perfect artifact. So, if you expect to put in a one shot prompt and get an answer back that you can use with no edits - good luck.

My last big tip is to not ask the tools to do too much at once. LLMs perform best when you break tasks down into smaller tasks. Think of yourself as a project manager breaking down a massive epic or a hypothesis that is too large. The smaller the unit the better.

The Product Development Process (PDP)

InfoBeans builds digital products. I assume if you are reading this guide you are also building digital products of some sort. This covers a lot of roles such as:

- Entrepreneur
- Product Manager
- Product Strategist
- Product Designer
- UX Designer
- Solution Architect
- Software Engineer
- Quality Assurance
- Business Leader
- Sales & Marketing

I prefer small, cross-functional teams that pack a punch. AI can help slot alongside these teams as a reliable co-pilot or intern throughout the journey.

This guide spans the entire product development process and is structured as:

1. Ideation
2. Market Research
3. Requirements Gathering
4. Prototyping
5. Development
6. Testing
7. Go To Market

This is a cycle that continuously loops and iterates. You can drop in and out at any part of this journey. Or you may start a new business and be running through from start to finish

How To Read This Playbook

Each of the seven sections of the product development process are broken down into the following parts:

Introduction to the section

An overview of why AI is beneficial

The risks associated with AI in this section

3-4 highest leverage points for using AI

- How you can use AI for this activity
- The potential business impact by leveraging AI
- Suggested tools

A list of more activities that AI can help with

A list of other useful AI tools

A note on tools: New AI tools are being built, launched and publicized at an absurd clip. This list is an initial pass of tools that I have personally investigated, but is not meant to be exhaustive. Check out [There's An AI For That](#) for a searchable directory of more tools. Many teams also launch on [Product Hunt](#).

Ideation

Ideation is the starting phase of the product development process. It is the spark that ignites innovation and creativity. This phase involves generating, developing, and refining new ideas. For software makers, ideation is not just about coming up with random concepts. It is about how we solve real user problems and meet market demands. In this stage, the objective is to explore as many possibilities as possible. We don't worry about feasibility or limitations.

Why AI

OpenAI's model, GPT-4, already places in the top 1% of humans in terms of creativity. You can have this creative genius available at your fingertips, whenever you want.

Integrating AI into the ideation process enables teams to generate many more ideas with different perspectives, much faster than a team of humans can. AI tools can analyze vast amounts of data, identify emerging trends, and suggest potential features or improvements based on user feedback and market analysis.

Risks

- **Over-reliance on AI:** Ideas may lack human emotional and cultural nuances.
- **Bias perpetuation:** AI may reinforce existing biases if trained on biased data.
- **Stifling human creativity:** Overuse of AI could limit human creative input.
- **Data privacy and security:** Handling large, sensitive datasets poses legal and ethical risks.

Activities

Conduct brainstorming sessions

Explore emerging technologies

Host ideation workshops

Generate user personas

Analyze feasibility and viability of ideas

Prioritize ideas based on strategic goals

Create user journey maps

Develop a product vision and mission statement

Design / product principles

Create hypothesis list / experiment dashboard

Prioritize feedback and identify common themes

Collaborate with groups across the organization

Root cause analysis

Strategy reviews

Create Amazon style press releases / memos

Artifacts

User personas

User journey maps

Ideation workshop documentation

Idea prioritization matrix

Product vision

Mission statement

Experiment plans

Experiment dashboard

Hypothesis list

Press Release

Strategy reviews

Business Model Canvas

Highest Leverage Opportunities

1. Be a creative thought partner
2. Find what has been done before at your organization
3. Schedule workshop sessions

1. Be a creative thought partner

AI serves as a valuable sparring partner. It can generate hundreds of innovative ideas that you might not think of. Then, you can select the most promising concepts for further development. You can apply this approach throughout the entire ideation process - tasks such as developing proto-personas, producing feature ideas, or even conceptualizing entire businesses.

Impact

- The advantage of using AI is the ability to generate a vast number of ideas from various sources or perspectives. Within a minute or two, you can have hundreds of ideas to choose from. These ideas can then be fleshed out. This translates into:
- Time saved on ideation activities (hours to days in the ideation stage)
- Hundreds to thousands more ideas produced in the same amount of time

Tools

Expona

ChatGPT

2. Find what has been done before at your organization

ProductOps is controversial, but one thing is clear: teams waste a lot of time redoing work that has already been done in their company. This is especially true for new hires but also affects even experienced teammates. There are likely examples of previous interview scripts that could be reused or workshop agendas that could be duplicated. These files are hidden in the depths of company shared drives, and surfacing them requires knowing where to look. Additionally, there are many ideas that have likely already been tried before at companies and didn't work. What if anyone could tap into all that information quickly? That is the power of AI.

Impact

Using AI to find templates, best practices, and avoid duplicated work can enhance efficiency in the ideation stage by 20-30x.

AI can quickly search through vast databases and repositories of information to identify relevant templates, proven methodologies, and industry best practices. These findings can be directly applied or tweaked to new projects. This not only streamlines the ideation process but also ensures that teams build on existing knowledge rather than starting from scratch.

Tools

Notion

Guru

3. Schedule workshop sessions

We are in the ideation stage! We want to have fun IDEATING. Nothing is less fun and hampers creativity more than the painful and boring task of trying to schedule time. People spend 13% more time in meetings and managers spend 66% more time in meetings than before the pandemic. This means it is harder than ever to schedule workshops across multiple team members. AI can streamline and automate this process, putting the burden on the robots who can handle this mindless grunt work a lot better than us.

Impact

As a frequent workshop facilitator, I must schedule workshops weeks in advance. This requires substantial coordination from several teammates (who are often costly). This context switching away from other tasks impacts the mental state of each of these teammates.

Tools

Reclaim

Calendar Hero

SidekickAI

My Top **Ideation** Tool:

Expona.io

I am biased since InfoBeans created it, but give Expona a whirl. It is free. We continue to improve it and its purpose built for the ideation process. You don't need to be a prompt engineering master. You don't even need to be mediocre at prompting. We handle that for you. Plus Expona is beautiful. It has tools such as getting to the root cause with 5 whys and quickly generating creative concepts. Plus it will help you generate new ideas for your persona. If you need something that has more tools and is more extensive, then many of your LLM platforms like ChatGPT or Claude will be sufficient.

Try It Out

Other AI Opportunities

Flesh out user personas including visuals

Create and flesh out journey maps

Write user narrative / press release

Generate ideas for names or concepts

Generate more root causes / run 5 whys for you

Synthesize workshop divergence

Generate hypothesis statements / experiment plans

Rewrite vision / mission statements

Prioritize concepts

Create validative questions for product principles

Create workshop agendas

More Tools

General Generation

[ChatGPT](#): The granddaddy. The king. Need I say more. For ideation, try asking it to imagine itself as something such as an expert in a space, a famous person in history, or a creative hat (7 hats exercise) before ideating on whatever you need

Image Generation

[Midjourney](#): An AI platform that creates art and designs from textual prompts, supporting visual brainstorming and ideation.

[Playground](#): Image generation focused on graphic design. Also gives you the ability to edit with chat.

[Ideogram](#): Quickly get four styles of an image via a prompt. Great for also including text.

Video Generation

[Synthesia](#): An AI video generation platform that creates engaging video content from text, supporting multimedia ideation and presentations.

Market Research

You've got the ideas flowing. You took advantage of AI to generate more ideas than before. Now you need to make sure that your product or feature meets the needs of your target audience. This phase involves gathering and analyzing data about market trends, customer behaviors, and competitive landscapes to make informed decisions. This phase reduces risks, optimizes how and what you spend time and money on, and increases the chance of success.

Why AI

AI speeds up data analysis and improves accuracy. Before AI you had to comb through data by hand. Write SQL queries or excel macros. AI tools can analyze customer feedback, social media trends, and competitors in near real-time. Machine learning identifies patterns and predicts market trends, aiding decisions on product features, pricing, and positioning.

By automating tasks and revealing hidden insights, AI allows researchers to focus on strategy and creativity, leading to better, market-aligned products.

Risks

- **Bias Perpetuation:** AI can reinforce existing biases if trained on biased data.
- **Over-reliance on AI:** May result in ignoring valuable human intuition and expertise.
- **Data Privacy Concerns:** Handling large volumes of sensitive data increases the risk of breaches.
- **Cost and Complexity:** AI tools can be expensive and require specialized skills to operate.
- **Lack of Contextual Understanding:** AI may miss nuances in customer behavior and preferences.

Activities

User interviews

Investigate pricing strategies

Analyze competitors' products

Regulatory / compliance

Research market trends and customer needs

Sales safari - social media / online forums

Gather insights from stakeholders

Industry conferences

Surveys

Interview transcripts / notes

SWOT Analysis

Compliance / regulatory
documentation

Feature gap analysis report

Highest Leverage Opportunities

1. Topic research
2. User research
3. Schedule user interviews

1. Get up to speed on a topic quickly

I am a consultant so I am often thrown into completely new situations and industries. I need to be an expert fast. You could be new to a job. Starting a new company. Or simply building out an area that you haven't been exposed to before. AI is the cheat code to this process.

Impact

I estimate that GenerativeAI tools can save days if not weeks of time getting up to speed on a topic. The tools can unearth things you wouldn't have thought of and let you go down new rabbit holes that will expose new truths.

Tools

Globe Explorer

Perplexity

2. User research

There is an epidemic in product development where teams don't speak to users. This results in a lot of features and products being built that no one wants. Or if they do want, no one uses. AI empowers teams to learn from customers faster. AI can help you draft interview guides and surveys. AI can quickly synthesize the research. It can obviously transcribe fast and well. It can help you answer questions on existing research that has been done without sifting through it yourself.

And in theory it can even facilitate entire user tests (via voice calls). And role play as the target user itself with synthetic user tests. I am on the fence about synthetic users as I believe that people are inherently unpredictable and robots are entirely predictable. However, it has the potential to gather quantitative data quickly in earlier parts of the cycle, when you would not otherwise have much data to reference.

Impact

The most significant impact will be enabling more research, resulting in less waste in software. Today, 80% of enterprise software features aren't used. That's a lot of waste! More research should drastically reduce this figure.

Regarding research execution, GenAI can save two to three hours on each research script, half to a full day of synthesis time, and potentially weeks by making old research more accessible, avoiding rework.

Tools

Google NotebookLM

Dovetail

Notably

3. Schedule user interviews

Just like with scheduling workshops, researchers are not paid big bucks to waste time scheduling interviews. However, everyone knows that the process takes time. Back and forth emailing. And unlike your team, you don't have access to the users' calendars. This results in a need to suggest, wait, and hope for a response. AI can automate the scheduling process, including handling backups, reschedules (which are frequent), and pushing potential interview candidates to future weeks based on their availability.

Impact

The impact will be comparable to the scheduling workshops task. The time saved will be substantial for the researcher, as they may be coordinating five or more interviews weekly across a large user base. While the tools are not yet available, they should, in the near future, also be able to do a better job of scheduling interviews more consecutively – for example, lining up a day of interviews, which will boost team productivity.

Tools

Clockwise

Calendar Hero

My Top Market Research Tool:

Zeda.io

This is a tough category for a single selection since there are many powerful tools that serve different purposes. Zeda takes the top prize for me because it handles the round trip of product discovery through execution. I like that you can collect user feedback and have feedback flow through your process all the way into the release notes. It has a strong mix of tooling that can be useful for teams in a number of parts of the product process.

Try It Out

Other AI Opportunities

Generate outlines or first drafts of reports / edit reports

Voice User Interviews

[UserCall](#): AI-driven platform for conducting and analyzing user interviews.

Synthetic User Interviews

[Synthetic Users](#): AI tool for generating synthetic user data for testing and research purposes.

Requirements Gathering

You validated your ideas. Prepared your feature list. Checked it twice. Now you need buy-in and to get ready to build. In the Requirements Gathering phase you use techniques such as interviews, surveys, and workshops to make your work shine. Effective requirements gathering improves communication and speeds up development. Ultimately, the requirements lay the foundation for design and implementation.

Why AI

AI removes the busywork from requirements gathering. AI tools summarize feedback from various sources. By automating repetitive tasks, AI frees up the human team to engage in more strategic and creative activities. Ultimately, AI improves the thoroughness and reliability of requirements leading to a smoother process.

Risks

- **Misinterpretation of Needs:** AI might misinterpret user feedback, leading to inaccurate specifications.
- **Bias in Data Analysis:** AI models trained on biased data can produce skewed requirements that don't reflect all user segments.
- **Only the Obvious:** AI tools often just find the average missing the potentially valuable details lurking on the edges.
- **Privacy Concerns:** Handling sensitive user data in AI systems can lead to privacy issues and regulatory non-compliance.

architecture specs

Highest Leverage Opportunities

1. Design wireframes
2. Build requirements
3. Code to spec
4. Create charts

1. Design wireframes

Wireframes are simple blueprints of a product's layout. They are low-fidelity outlines, often in black and white that outline the functionality of each page or screen. Wireframes crystalize requirements. Unlock engineering. And can even be used for user testing.

I love to sketch wireframes by hand before digitizing them. This process can be automated by taking a photo of a sketch and having AI convert the sketch into a digitized wireframe. There are also text to wireframe tools. Predictive wireframing where as you actively create your wireframe, other elements are immediately added based on what common patterns are- just like predictive text on your phone or document editor.

The most successful tools will integrate into designers' existing workflows. This likely means they are built on top of Figma or have an export to Figma feature.

Impact

Today, AI's impact results in hours to many days saved. In the future, wireframe time could be reduced by 90% as more data is gathered about how wireframes are built and integrated into the models.

Wireframing is likely to become an almost automatic and effortless part of any process in the future with minimal work required.

This is advantageous because it will also allow designers to dedicate more time to the creative aspects of their jobs. They can also explore more inventive approaches to problem-solving since the fundamental elements will be handled for them.

Tools

V0 by Vercel

UIZARD.io

Galileo AI

2. Build out requirements documents

Writing documentation is the bane of many product managers. I hate it. LLMs are particularly good at text. Most requirements documents are used for basic internal alignment, but collect dust shortly after creation. This makes documentation a fantastic use case for offloading to AI tools.

Impact

90-95% of the time it takes to build out requirements documents can be saved via AI tools. Most of the effort in Product Requirement Documents (PRDs) and other documentation is spent on formatting filler and existing requirements. Many enterprise software applications have reusable components from across the enterprise, such as sign-on requirements.

Tools

ChatPRD

Fibery.io

ClickUp

3. Code to Spec

Enterprises are burdened with legacy codebases accumulated over decades. Documentation is scarce. It is fortunate if there is even one engineer in the entire company who fully understands how the code operates. Debugging can take days. The situation is further complicated if the code is written in obsolete languages such as COBOL, Fortran, or Pascal. In such cases, manual code analysis becomes impractical. AI, however, can systematically examine the entire codebase and generate specification documents. These documents can then be used for code maintenance or, more likely, to guide a new project to rebuild the system using a modern framework.

Impact

The impact of code to spec is almost impossible to quantify. It is enormous. For many large projects it will save months or years of mindless work by large groups of engineers and product people. In other cases, it will enable a smooth rebuild in what otherwise would be a complete clusterfuck.

Tools

4. Create charts from data and analytics

Cases need to be built for new products or features. This usually requires demonstrating why it would be a wise idea or investment to pursue a particular course of action. A common way to do this is to create charts that explain your position. GenAI excels at sifting through data and presenting it in an easily consumable manner. Now you don't need a data scientist or an Excel expert.

Impact

These tools can save hours of manual charting work. Additionally, charting is more democratized, as anyone can now create charts without the technical proficiency that was once necessary.

Graphmaker

Pecan

My Top Requirements Gathering Tool: ChatPRD

**You**

This is really comprehensive and looks great, but I want to be more specific about my success metrics. Right now I have 100 users and 5 inbound requests about teams. What would be a good set of actual targets for the first month, and 90 days of the product launch?

**ChatPRD**

I'm glad you found the outline comprehensive! Let's dive into refining the success metrics for the first month and for 90 days after the product launch.

Success Metrics - First Month

1. Increase the number of team-related signups (organization accounts) to a target of 10 teams.
2. Convert 10% of existing individual users (10 users) to team tiers within their organizations.
3. Achieve a team user retention rate of at least 80%.

Success Metrics - 90 Days

1. Increase the total number of team-related signups (organization accounts) to a target of 30 teams.
2. Convert 25% of existing individual users (25 users) to team tiers within their organizations.
3. Maintain or improve the team user retention rate, aiming for at least 85%.

These targets are based on your current user base and inbound requests, while leaving room for growth. Feel free to adjust these numbers based on any other factors or insight you may have about your users and market. Does this provide more clarity on the success metrics for the ChatPRD teams feature?

The obvious pick here would be ChatGPT, but I am going to go with a more focused tool - ChatPRD. I love the founder story of this project (check out Claire Vo) and I love that this project helps teams build requirements, but also gives suggestions on how to improve. While I am not a big fan of too much documentation, I think this tool does a great job of quickly getting documents built and iterated. I particularly love that it has a built in document editor so you can work seamlessly between a chat interface and the document itself.

Technical Diagrams

Eraser AI: AI-powered tool for technical diagrams and reference documents with the ability to edit.

Prototyping

It is time to bring your ideas to life. To turn the sketches into visual dreams. In the Prototyping stage you explore design concepts, test functionality, and gather user feedback.

Prototyping allows teams to visualize and interact with the product early on. You can identify potential issues before spending time on full-scale development.

Why AI

AI helps teams create more concepts quickly and predicts the common patterns and themes. This allows teams to explore more options in less time. AI can simulate user interactions and predict potential usability issues. By automating repetitive tasks, AI frees up designers and developers to focus on creative and strategic aspects. AI in prototyping leads to more innovative, user-friendly, and market-ready products, while reducing development time and costs.

Risks

- **Lack of Creativity:** AI can't fully capture the creative aspects of human design.
- **Technical Limitations:** AI may struggle with complex or unique design requirements.
- **Cost of Implementation:** Developing and maintaining AI tools can be expensive.
- **Limited User Feedback:** AI might not effectively interpret user feedback for iterative improvements
- **Dependence on Quality Data:** Poor quality or insufficient data can lead to inaccurate prototypes.

Moodboards

Highest Leverage Opportunities

1. Design prototypes
2. Storytelling
3. Beautiful presentations

1. Design prototypes

It is time to bring your designs to life. Similar to generative wireframing, the same approach can be applied to high-fidelity visual designs and prototypes. The most promising approach today is to use existing design systems and apply them to wireframes dynamically. Tools like Uizard let you go from a text description to a full prototype, and other Figma plugins aim to do the same.

Impact

Designers spend days and hours executing this work. The big impact here is to free up designers time to be working on more interesting creative projects and ideating potential solutions. Then bringing those ideas to life through these tools. So not only could this speed the prototyping process up from weeks to days, but it could also allow more creative applications to be built where table stakes functionality is built using common User Interface (UI) patterns and the real time is spent coming up with creative solutions.

Tools

Skippr

Creatie.ai

Visily

2. Edit reports for clarity and storytelling

Product teams need to tell a compelling story about the data or insights they have gathered to the business. It involves presenting the complex work in a comprehensible and digestible manner. Many teams struggle with this. This means that even if they have done good work, it might not be fully appreciated. AI can assist teams in refining their reports. Craft outlines of stories. Package up information in different ways to different groups. For example, AI can be utilized to frame the business case for a CFO differently than how information would be presented to the risk and legal team.

Impact

While there is certainly a time saving factor at play here, the bigger impact will likely be in improved reports. This will mean more smart projects will be greenlit. And more respect will fall on product teams.

Tools

ChatGPT

Google Gemini

STORYD StoryD

3. Create consistent and good looking presentations

I am biased because I studied design, but there are a lot of horrible looking presentations out there. Good design doesn't mean something looks pretty. Quality design in presentations helps them be read and understood more easily. It focuses the audience's attention on what matters. Word soup on a poorly designed deck means people tune information out that might be important. AI can help teams quickly create beautiful presentations. And you don't need to be an expert designer to pull this off.

Impact

Some people spend days and hours trying to design a presentation. Most teams don't have time for this, so just do the bare minimum when building presentations. AI tools are coming onboard quickly to help quickly build draft decks that look good with the content that you have. This will not only save time, but also make these decks easier to understand. Similarly to storytelling, this will mean more ideas are properly represented and shared with broader teams.

Tools

beautiful.ai Beautiful AI

 Gamma

My Top Prototyping Tool: Figma AI

This is a newer AI feature set on the dominating UI designer platform. Given it is part of designers pre-existing workflow it has usurped the original stalwarts like Uizard and Visily. Figma's AI features include the ever-present text to interface, but I think even more valuable and useful are the smaller features that help make designers' lives better. For example, filling in sample content with realistic text, auto-naming layers and just being better about how content is extended. Figma's features are newer, but look like they will be a massive time saver for designers and teams.

[Colormind](#): AI-powered color scheme generator for creating appealing and harmonious color palettes for designs.

Design Systems

[Relume](#): AI-powered tool for creating and organizing design systems to streamline the prototyping process.

Development

Designs are done. Risky assumptions validated. Your users can't use a prototype, they need a fully functioning product. The Development phase takes those designs and brings the software to life. This stage involves coding, integrating various third parties, finalizing designs, polishing UX copy and aligning teams.

Why AI

AI can enhance efficiency, accuracy, and innovation of the Development phase. AI tools can automate repetitive coding tasks, identify and fix bugs, and optimize code for better performance. AI can also assist in predictive maintenance, forecasting potential issues before they become critical. These tools can help with documentation and pull requests.

Risks

- **Technical Debt:** AI-generated code can introduce complexities and hard-to-maintain codebases.
- **Integration Challenges:** AI components may face difficulties integrating with existing systems and workflows.
- **Security Vulnerabilities:** AI-generated code might overlook potential security risks and vulnerabilities.
- **Scalability Issues:** AI solutions may not scale well with increasing user demands or complex applications.
- **Dependence on Quality Data:** Poor quality or insufficient training data can lead to suboptimal AI performance.
- **Limited Flexibility:** AI-generated solutions might lack the flexibility to adapt to unforeseen changes or specific user needs.

Activities

Define development milestones

Integrate third-party APIs

Convert features into smaller tasks

Continuously deploy and iterate on features

Assign tasks to team members

Ensure security measures

Conduct daily standup meetings

Refactor code

Collaborate with design / product / engineering for rapid iteration or feedback

Code peer reviews

Monitor progress for any blockers

Document progress to stakeholders

Determine metrics to track

Sprint review / planning meetings / retros

Implement code and features

Write UX Copy

Write clean and maintainable code

Make sure code is accessible to standards

Artifacts

Development milestones

Task breakdown and assignment

Meeting summaries and presentations

Codebase with clean code

Pull Requests

Code documentation

Deployment logs

Best practices

Standards documents

Metrics reports and briefs

Product roadmap

Release notes

Highest Leverage Opportunities

1. Write / edit UX copy
2. Co-pilot for writing code
3. Code documentation
4. Accessibility

1. Write / edit UX copy

Oftentimes teams neglect the copy that appears within applications. The button copy. Error messaging. General text descriptions. GenAI can help you write compelling copy. Make it easier to understand. More consistent and more actionable. And if your app is multilingual? AI can help dynamically translate the app too!

Impact

The most significant benefit will be a higher level of quality in applications. An area that is often neglected will now be able to be prioritized. For some teams, a role or part-time role of a UX writer or content editor may be replaced.

Tools

ChatGPT

copy.ai

Copy AI

2. Co-pilot for writing code

There is a lot of hype around AI being used to write code. It makes sense. Developers are an expensive bunch. And code is text-based with many patterns, so it is well suited for LLMs. At InfoBeans we have seen engineers use AI as a collaboration partner. For example, engineers have used AI co-pilots to get help writing functions, converting code they know how to do in one language (ie Ruby) to a new language (ie Python) and helping sort through API documents. There are a number of highly-funded startups looking to automate more of the engineers' jobs such as writing more complex code and solving bugs on their own.

Impact

There is a wide range of stories here. As a baseline, we can likely assume that engineers are approximately 10% faster with AI. And in bullish estimates, this number increases to 10x or more. Applying the concept of the 10x engineer to a junior engineer empowered by AI

Tools

GitHub Copilot

Cursor

[Supermaven](#)

3. Generate pull request descriptions & documentation

I shared before that product people dislike documentation, but developers despise it even more. It represents the bane of their existence. Consequently, most codebases lack documentation. This is not often a problem for smaller codebases, but as they age and grow more complex, it becomes a liability. AI can improve codebases and pull requests (PRs), allowing developers to focus on the fun part of their work. Ya know? The code

Impact

Clear and thorough in-code documentation benefits everyone. Better PRs make it easier for colleagues to review code. The time saved by doing this, like helping people flesh out product requirement documents, can be significant, often exceeding 90%.

Tools

Bito

DocuWriter

Docify

4. Accessibility

1 in every 6 people in the world has a significant disability, and the majority of them use the internet. Unfortunately, many websites do not allow them to browse easily. In many cases, this exposes companies to lawsuits for not supporting accessibility standards. AI can assist us in checking our designs and websites to ensure that they meet accessibility standards. Additionally, AI systems can proactively update websites to make them accessible.

Impact

AI will enable any website to be easily accessible with no additional effort required. This will save weeks of design and engineering time. These websites will not be susceptible to lawsuits. And most importantly, more people will be able to browse your website and purchase your products.

Tools

AccessiBe

Userway

My Top **Development** Tool:

Cursor

There is a battle going on for the top AI assistant on code writing between Cursor, GitHub Co-pilot and Supermaven. As of writing, I am seeing the most love from engineers on Cursor. I think the ability to have inline AI-powered autocomplete, help with documentation, automated test writing and then just general help on engineering is an absolute gamechanger. We have seen that AI coding assistants are not great at writing novel code, but can help with the smaller tasks that engineers end up doing frequently. I look forward to a healthy competition here for co-pilots on writing code

Try It Out

Other AI Opportunities

Generate roadmaps

Write documentation / comments in code

Write test cases

Do code reviews

Write release notes

Create metrics reports and briefs

Automatically summarize meetings and action items

Generated meeting notes

Create deployment logs

Check code against codebase standards / best practices

Find best practices / templates within org

Come up with ideas for metrics to track

Go from design to code

Help debug a problem in the code

Create decks / reports

Generate daily standup based on what was accomplished / tracking board

Summarize feedback from different departments

More Tools

Meeting Summaries

[Granola](#): Locally hosted AI transcription tool that summarizes meeting notes into various templates.

Internal Tools

[Retool](#): AI-enhanced platform for building internal tools quickly and efficiently.

AI Agents

[Abacus.ai](#): AI platform for building, deploying, and managing machine learning models and AI applications.

Design to Front-end

[Builder.io](#): Give developers and marketers an AI-powered platform to quickly transform designs into optimized web and mobile experiences.

Testing

A buggy product is not good. It erodes user trust. Hurts the experience. And can result in customer churn. The Testing stage involves testing the product in different ways, such as unit testing, integration testing, system testing, and user acceptance testing. The goal is to identify and fix defects, verify performance, and ensure the product is ready for release.

Why AI

AI expedites the Testing phase by increasing efficiency, accuracy, and coverage. AI testing tools can automate repetitive and time-consuming tasks. They can create test cases. Write the tests themselves. And execute them. Machine learning algorithms can adapt and improve test scenarios based on real-time data, ensuring comprehensive testing coverage. AI tools help teams achieve faster and more thorough testing, resulting in higher quality products and a smoother path to market.

Risks

- **False Positives/Negatives:** AI may incorrectly identify bugs or miss critical issues, leading to unreliable test results.
- **Complexity in Debugging:** AI-generated test cases and results can be difficult to interpret and debug.
- **Security Risks:** AI in testing may inadvertently expose sensitive data or fail to identify security vulnerabilities.
- **Limited Contextual Understanding:** AI might miss context-specific issues that human testers would catch.
- **Maintenance Challenges:** AI testing tools require ongoing updates and maintenance to stay effective and accurate.

Activities

Develop test plans

Collaborate to resolve issues

Define test cases and scenarios

Conduct performance testing

Set up testing environments

Conduct security testing

Select testing tools

Conduct compatibility testing

Automate test cases

Conduct regression testing

Execute automated test scripts

Integrate automated tests into
CI/CD pipelines

Analyze test results

Report and prioritize bugs

Artifacts

Test plans

Test strategy documents

Test cases and scenarios

Testing environments

Test documentation

Test results and reports

Training materials

Change management plans

Highest Leverage Opportunities

1. Define and write test cases
2. Write automated tests

1. Define and write test cases

Many companies have lean teams in the testing department. Staying on top of test cases just like staying on top of documentation is a challenge. Luckily, AI with proper context and understanding of code can begin to write draft test cases for your team to leverage in testing.

Impact

More test cases means more paths for teams (or AI agents) to test. Which means fewer bugs in the software. Which means more happy customers. Plus, more time for engineers to be working on new innovations instead of wasting their time fixing bugs.

Tools

Testsigma

Jira to Test Case

2. Write automated tests

With test cases defined, many unit and integration tests can be completed entirely by AI. While AI today at least struggles to create complex or novel code, it is pretty good at writing basic test cases. It can help teams who don't practice Test Driven Development (TDD) write more consistent test cases.

Impact

Similar to the story above, this should help teams focus their testing efforts on non-happy path flows. Expanded test coverage will give more comfort to teams that things are in good shape.

Tools

GitHub Copilot

Cursor

Tabnine

My Top **Testing** Tool: Testsigma

I think one of the biggest wins for engineers will be having AI handle more and more automated tests. AI should easily be able to write both unit and integration tests and ensure deployments properly pass these test cases. Test sigma is focused on solving this problem. It is already good and I expect it will improve dramatically in the coming months and years because they are so hyper focused on solving that problem.

Automated Tests

[Mabl](#): Simplify your automated testing with intelligent, self-healing test scripts and integrated reporting.

[Testim](#): Accelerate your testing cycles with AI-enhanced test automation platform, featuring adaptive learning and intuitive test creation.

Go To Market

If you build it, people will come. This is a common misconception. You need to market your product. Get the word out and get users using it! This phase involves creating and executing plans to introduce the product to customers, including marketing, sales, distribution, and customer support initiatives. And turn all the hard work into something that benefits your users and your business.

Why AI

AI unlocks all sorts of benefits in the go-to-market phase from speeding up the creation of content to personalizing campaigns at scale. AI tools can tailor messages that increase conversion rate. Sales processes benefit from AI through lead scoring, predictive analytics, and automated outreach. By leveraging AI, companies can achieve more with less and drive higher engagement and conversion rates.

Risks

- **Over-reliance on AI:** Excessive dependence on AI may reduce the human touch in customer interactions and brand messaging.
- **Inaccurate Customer Insights:** AI might generate misleading customer insights due to flawed, insufficient or outdated data.
- **Complexity in Implementation:** Integrating AI into existing marketing systems and workflows can be challenging and time-consuming.
- **Unpredictable Outcomes:** AI tools can sometimes produce unexpected or suboptimal results, affecting campaign performance and brand reputation.

Activities

Create landing pages

Create social media posts

CRM

Marketing Plan

Highest Leverage Opportunities

1. Generate ad creative
2. Customer service inquiries
3. Data enrichment
4. Personalized outreach

1. Generate ad creative

Text creative. Static images. Videos. AI can do it all. And it can continue to refine and improve based on what is likely to convert best. AI can be used to create portions of graphics that you slice together. AI can create imagery based on what you dream up and what the data says will perform.

Impact

Significant time and money can be saved on the creation of this content. Large teams can be dropped down to a single person or two working through the content suggestions. And what if these ads perform better than the human version? More revenue. Less ad spend. More profit.

Tools

 Canva

 Jasper

 Creatopy

2. Customer service inquiries

Another space with tremendous potential. Customer service teams are often answering similar or repetitive questions. Now those common questions can be answered directly by AI. These AI agents can work with customers to solve their issues. If something is too complex a human can come in. It also frees people up to empathize with customers and look at upselling opportunities.

Impact

An early use case from Klarna claims that the AI agents could handle $\frac{2}{3}$ of the CS work, accomplishing the equivalent of 700 customer support agents. This level may be ambitious at the current stage of AI development, but it is likely to become a reality in the next three years. Additionally, there is the human impact of empowering individuals to engage in more meaningful work. After all, who genuinely enjoys spending their days copying and pasting from a script?

Tools

Intercom

Zendesk

CoSupport

3. Data enrichment

Your best salespeople do not want to be doing data entry. They want to be selling. Meeting with prospects. Shaking hands. Kissing babies. But today, sales and marketing teams waste a lot of time doing glorified data entry. Building lists of potential targets. Value props. Customer segments. Fleshing out spreadsheets and other databases. Making sure that precious CRM is up to date. AI can handle all this busy work. More accurately. Faster.

Impact

Utilizing AI here can save hours of team members' time. This will free up your sales representatives to focus on what they do best: selling. If you have teams dedicated to data harvesting, their size can be significantly reduced. And since these positions typically have high attrition rates, AI will provide each of your top sales representatives with their own dedicated research team.

Tools

4. Personalized outreach

So now you are able to get data faster without wasting valuable sales people time. You can also save their time on the numbers game of cold outreach. AI can help you personalize at scale. So instead of just sending a boilerplate email that is only changed based on ICP, each email can be unique. This helps you avoid spam filters and maximizes the chances of a response.

Impact

Writing a good cold email can take 2 to 4 hours. Imagine the time savings when extrapolated across hundreds of emails. Cold outreach is often performed by Sales Development Representatives (SDRs) who have a high turnover rate. This can help companies avoid the boiler room aspect of this role. Imagine the impact for startups where the founder is responsible for sales.

Tools

Unify GTM

Apollo.io

Reply.io

My Top **Go To Market** Tool: Zapier

Another tough category due to the breadth of opportunities in this space and the number of tools that are focused on improving lives here. Zapier has been around forever and provides a lot of flexibility in what it offers. Zapier's recent advances in AI have been impressive because they have taken their already powerful platform and made it even easier for teams to use. Additionally, its seamless integration into ChatGPT actions makes it a secret weapon to integrate many tasks.

Caveats And Pitfalls

If you can't tell, I am bullish on the integration of AI into the product development process. But with great technology comes great responsibilities. And risks!

If you recognize the potential pitfalls ahead of time, you will be more likely to leap over them.

Over Reliance On **AI-Generated Outputs**

Don't fall into the trap of believing everything the AI tells you. At the beginning I warned you that LLMs act extremely confident in their answers. I would go as far to say that LLMs are world renowned bullshitters! Not only that, but the answers are also based on the average of the internet. So it might not be at the level you expect. Junior team members are particularly at risk of using AI generated content without giving thought to what lurks within.

- **Caveat:** AI does not replace human expertise, especially in understanding nuanced customer needs and context-specific challenges.
- **Mitigation Strategy:** Use AI as a thought partner, but never just use AI generated content without a review by an expert

Data Quality And Bias

The outputs of GenAI are only as good as the data it is trained on. Poor quality or biased data can lead to flawed or biased outputs. This has a number of ethical considerations such as perpetuating stereotypes. Not good and a significant risk as AI gets integrated into more tools.

- **Caveat:** Inadequate or biased training data can lead to outputs that are not only unhelpful but potentially harmful.
- **Mitigation Strategy:** Regularly audit and update the training datasets to ensure diversity and relevance. Incorporate checks for biases and implement corrective measures when needed. Ensure transparency with users about how AI influences the product experience.

Intellectual Property And Originality Issues

GenAI generates content by learning from endless sources of existing data across the internet. This blurs the lines of copyright and intellectual property (IP).

- **Caveat:** Using AI-generated content without proper verification can lead to IP infringements.
- **Mitigation Strategy:** Always verify the originality of AI-generated designs or content. Look to legal counsel for review. And no, that doesn't mean asking ChatGPT's legal advice!

Loss Of Personal Touch In Design

GenAI can streamline the design process by generating hundreds of options quickly. But it is a machine, so that means you may lose the human touch.

- **Caveat:** Products that rely heavily on AI can lack the unique insights and creativity that come from our unique human minds.
- **Mitigation Strategy:** Use GenAI as a tool to augment human creativity, not replace it. Final product decisions should incorporate human judgment and customer feedback. Use Product Principles and design critiques to make sure your product has a high level of craftsmanship.

Security And Privacy Concerns

GenAI requires access to vast amounts of data, including potentially sensitive information. This means there is real risk with data security and user privacy.

- **Caveat:** Breaches in AI systems can lead to significant data leaks, affecting both the organization and its customers.
- **Mitigation Strategy:** Implement robust security protocols, conduct regular security audits, and ensure compliance with data protection regulations. Self host your projects and minimize leveraging systems that you don't host yourself.

Complexity In Integration And Maintenance

It is not always technically easy to integrate GenAI into your workflows. And it isn't cheap! NVIDIA is one of the most valuable companies in the world for a reason. Maintenance of these systems also requires continuous updates and monitoring. It is likely that GenAI will allow for massive improvements in efficiency, but it won't be free.

- **Caveat:** The technical debt and ongoing costs associated with GenAI integration can be substantial.
- **Mitigation Strategy:** Plan for long-term maintenance and updates by creating a Total Cost of Ownership (TCO) and Return on Investment (ROI) analysis before beginning a project. Train internal teams or collaborate with AI experts to manage and update GenAI tools effectively. Track spending and look to optimize across different models

Getting The Most Out Of Your Team

This is a new tool. Many people on your team will be uncomfortable getting started. You are reading this guide so likely are at the front of the pack. It is up to people like you to bring people along for the ride.

There are three key themes that I recommend to help teams optimize their workflows for AI and learning:

1. Embrace experimentation
2. Pair junior and senior teammates
3. Promote knowledge sharing across the organization

Here's how you can use these techniques to deliver better results at a faster pace.

Embrace Experimentation

Experimentation is the key to success. This is true in both developing products as well as the process itself. Fail fast! And learn from it. Encourage teams to explore new ideas and experiment with different approaches. Here are three strategies to build the experimentation muscle:

- **Encourage Risk-Taking:** Create an environment where team members are not afraid to take calculated risks and try new ideas. Reward innovative thinking through promotions or public praise from leadership. You need people to know it is OK to fail.
- **Time and Budget Allocation:** Dedicate specific time and budget for teams to explore and experiment with AI tools, technologies, and methodologies. Models cost a lot in compute cycles, which means there is a cost associated with trying these tools. Make it easy for teams to expense it.
- **Collaborative Ideation:** Schedule brainstorming sessions where team members can share their ideas and discuss potential solutions. Encourage cross-functional collaboration and diverse perspectives to fuel creativity and generate innovative AI-driven approaches.

Pair Senior And **Junior Team Members**

Pairing is beneficial both for individual growth and team performance. I have found that junior makers are more willing to try and embrace AI than senior practitioners. At the same time, junior teammates are also more prone to taking what is returned at face value or missing nuances that senior practitioners would catch. This pairing approach creates a learning environment where senior teammates are forced to experiment more with AI and help junior teammates catch potential mistakes. Try these three approaches:

- **Mentoring Programs:** Establish structured mentoring programs where senior AI practitioners can guide and support the growth of junior team members. This can be done through one-on-one mentorship sessions, knowledge-sharing workshops, or rotational assignments.
- **Reverse Mentoring:** Encourage junior team members to share their fresh perspectives, insights, and technical skills with senior team members. After all, they have likely been using ChatGPT longer than the rest of the team. Showing senior and mid-level teammates how they incorporate it will be eye opening.
- **Project Collaboration:** Look for opportunities for senior and junior team members to collaborate directly on projects. The best way to learn is by applying things directly to the work!

Promote Knowledge Sharing Across The Organization

Sharing knowledge and best practices across your organization is essential to unlock the full potential of AI in product development. Here are three ideas:

- **Communities of Practice:** Establish internal communities where team members with a common interest in AI share their experiences, exchange ideas and collaborate on solving problems. Slack channels, consistent meetings and workshops can be used to facilitate.
- **Documentation and Lessons Learned:** Encourage teams to document their experiences, challenges, and successful implementations. Making this information accessible to other teams through knowledge repositories on Sharepoint, Notion or just announcing in Slack will allow for broader visibility and learning.
- **Learning Opportunities:** Provide opportunities for continuous learning and growth through training sessions, workshops, and conferences. Support team members' participation in external events related to AI enables them to stay up-to-date with the latest trends and technologies.

You must enable teams to experiment, share knowledge, and collaborate effectively. Foster a culture of experimentation. Piar senior and junior team members. Promote knowledge sharing. Before you know it, your teams will be flying with their thousand AI interns.

Looking Ahead!

I hope this playbook helps you accelerate your product development process. I hope it gives you some new ideas. Inspires you. Encourages you to try a new tool or two.

As I write this closing chapter, Apple is dropping their much anticipated AI play, Apple Intelligence. The space is moving FAST. Every day new tools are launched. New groundbreaking models are revealed by the research companies.

I am bullish that the road ahead is going to be exciting. We are going to be able to do better work, faster. I want to encourage you to experiment and to take action.

And if you need help supercharging your teams with AI, please reach out. The conversation can be continued at:
